Cleaning our bigrams

So obviously many of the stop words we removed from the last data.frames are popping up. Let's create two
new columns to clean them up a bit.

```r
library(tidyr)

bigrams_separated <- ama_bigrams %>%
  separate(bigram, c("word1", "word2"), sep = " ")

bigrams_filtered <- bigrams_separated %>%
  filter(!word1 %in% stop_words$word) %>%
  filter(!word2 %in% stop_words$word)

# new bigram counts:
bigram_counts <- bigrams_filtered %>%
  count(word1, word2, sort = TRUE)

bigram_counts
```

```
##                              word1                  word2      n
## 1                         magnetic               resonance 17036

Great! Now we have a new count of bigrams without those pesky stop words. Often we will want to visualize a network of which words occurs with eachother. We can easily do so in ggplot below! graph_to_data_fram() allows us to visualize "to" and "from" relations in our words using edges!

```r
library(igraph)
```

```
##
## Attaching package: 'igraph'
```

```
## The following object is masked from 'package:tidyr':
##
##     crossing
```

```
## The following objects are masked from 'package:dplyr':
##
##     as_data_frame, groups, union
```

```
## The following objects are masked from 'package:stats':
##
##     decompose, spectrum
```

```
## The following object is masked from 'package:base':
##
##     union
```

```r
library(ggraph)

bigram_graph <- bigram_counts %>%
  filter(n > 1000) %>%
  graph_from_data_frame()

set.seed(2017)

ggraph(bigram_graph, layout = "fr") +
  geom_edge_link() +
  geom_node_point() +
  geom_node_text(aes(label = name), vjust = 1, hjust = 1)
```
Interesting! There seems to be a lot of words relevant for things associated with the study of the heart. This is expected as in our search we paired the terms "fMRI" and ""heart" together. Which gave us almost the entirety of the literature from heart research. Next report we will focus on how to address this issue and hopefully get into some prediciton!
